

CITY OF TALLAPOOSA WATER SYSTEM

2022 CONSUMER CONFIDENCE/ANNUAL DRINKING WATER REPORT

GA Community Water System Name: City of Tallapoosa Water System

GA Water System ID #1430002

Name and phone number of water system contact: Philip Eidson

Phone: 770-574-2345

This report details information on the The City of Tallapoosa Water System for the calendar year 2022 unless otherwise noted as required by the Safe Drinking Water Act (SDWA) The City of Tallapoosa purchases water from the Haralson County Water Authority. This report is designed to provide details about where your water comes from, what it contains, and how it compares to standards set by regulatory agencies. This report is a snapshot of last year's water quality. We are committed to providing you with information because informed customers are our best allies. Last year, tests were conducted for over 100 contaminants. We only detected 11 of those contaminants, and found none for the Tallapoosa area to be at a level higher than the EPA allows. This report can be found at <http://haralsoncountywaterauthority.com/water-quality-report/>.

Where does my water come from?

Your water comes from the Haralson County Water Authority who takes their water from the Tallapoosa River, Sims Wells, and Cleburne County Alabama.

Source water assessment and its availability.

Our community has completed a source water assessment that provides more information about our water source. Out of ninety-five potential sources of contamination sited in the report, seven fell in the low priority range, eighty-eight fell in the medium priority range, and zero fell in the high priority range. Most potential sources of contamination fell in the medium priority range and do not warrant a significant level of concern. The overall susceptibility score for Haralson County Water was medium. A copy of this report can be found at the Haralson County Water Authority office.

Why are there contaminants in my drinking water?

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's (EPA) Safe Drinking Water Hotline (800) 426-4791. The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity: microbial contaminants, such as viruses and bacteria that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban storm water runoff, industrial, or domestic wastewater discharges, oil and gas production, mining, or farming; pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm water runoff, and residential uses; organic Chemical Contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations urban storm water runoff, and septic systems; and radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities. In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

How can I get involved?

Regularly scheduled meetings of the Mayor and Council are held on the second Monday of each month at 6:00 p.m. at the Tallapoosa City Hall, 25 East Alabama Street, Tallapoosa, GA, 30176. The Haralson County Water Board meets the second Tuesday of each month at 9:00 a.m. in the conference room at the Water Authority office in Buchanan, GA. Your participation and/or comments are welcome at these meetings.

Violations and Exceedances.

Level 1 and Level 2 Assessment for Sanitary Defects. Coliforms are an indicator Bacteria found naturally in the environment and are used presence/absence indication that other, potentially harmful, Pathogens may be present, or that a potential pathway could exist through which contamination may enter the drinking water Distribution System. We found Coliform indicating the need to look for potential problems in the water treatment or distribution. When this occurs we are required to conduct assessments, to identify problems and to correct any problems that are found. During the past year, Haralson County was required to conduct one Level 1 and one Level 2 Assessment. Each were completed and we were required to take Zero correction actions.

Cross Connection Control Survey.

The purpose of this survey is to determine whether a cross-connection may exist at your home or business. A cross connection is an unprotected or improper connection to a public water distribution system that may cause contamination or pollution to enter the system. We are responsible for enforcing cross-connection control regulations and insuring that no contaminants can, under any flow conditions, enter the distribution system. If you have any of the devices listed below, and are unsure if there is a cross connection please contact , Philip Eidson and/or Boyd Coggins at 770-574-2345 so that we can discuss the issue, and if needed, survey your connection and assist you in isolating it if that is necessary .

- Boiler/Radiant heater (water heaters not included)
- Underground lawn sprinkler system
- Pool or hot tub (whirlpool tubs not included)
- Additional source(s) of water on the property
- Decorative pond
- Watering trough

Source Water Protection.

Protection of drinking water is everyone's responsibility. You can help protect your community's drinking water source in several ways:

- Eliminate excess use of lawn and garden fertilizers and pesticides – they contain hazardous chemicals that can reach your drinking water source.
- Pick up after your pets.
- If you have your own septic system, property maintain your system to reduce leaching to water sources or consider connecting to a public Waste water system.
- Dispose of chemicals properly; take used motor oil, paint, stain, etc., to a recycling center.
- Volunteer in your community. Find a watershed or wellhead protection organization in your community and volunteer to help. If there are no active groups, consider starting one. Use EPA's Adopt Your Watershed to locate groups in your community, or visit the Watershed Information Network's How to Start a Watershed Team.
- Organize a storm drain stenciling project with your local government or water supplier. Stencil a message next to the street drain reminding people "Dump No Waste – Drains to River" or "Protect Your Water." Produce and distribute a flyer for households to remind residents that storm drains dump directly into your local water body.

Additional Information on Lead.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. . The City of Tallapoosa is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline (800) 426-4791 or at <http://www.epa.gov/safewater/lead>.

Additional Information for Nitrate.

Nitrate in drinking water at levels above 10 ppm is a health risk for infants of less than six months of age. High nitrate levels in drinking water can cause blue baby syndrome. Nitrate levels may rise quickly for short periods of time because of rainfall or agricultural activity. If you are caring for an infant, you should ask for advice from your health care provider.

Description of the Water Treatment Process.

Your water is treated in a "treatment train" (a series of processes applied in a sequence) that includes coagulation, flocculation, sedimentation, filtration, and disinfection. Coagulation removes dirt and other particles suspended in the source water by adding Liquid Alum to form tiny sticky particles called "floc," which attract the dirt particles. Flocculation (the formation of larger flocs from smaller flocs) is achieved using gentle, constant mixing. The heavy particles settle naturally out of the water in a sedimentation basin. The clear water then moves to the filtration process where the water passes through sand, gravel, and Anthracite Coal in filters that remove even smaller particles. A small amount of Lime is used for PH balance, a small amount of chlorine is used to kill bacteria and other microorganisms that may be in the water and a small amount of Fluoride is then added for Cavity prevention before water is stored and distributed to homes and businesses in the community.

Water Conservation Tips.

Did you know that the average U.S. household uses approximately 400 gallons of water per day or 100 gallons per person per day? Luckily, there are many low-cost and no-cost ways to conserve water. Small changes can make a big difference - try one today and soon it will become second nature.

- Take short showers – a 5-minute shower uses 4 to 5 gallons of water compared to up to 50 gallons for a bath.
- Shut off water while brushing your teeth, washing your hair and shaving and save up to 500 gallons a month.
- Use a water-efficient showerhead. They're inexpensive, easy to install, and can save you up to 750 gallons a month.
- Run your clothes washer and dishwasher only when they are full. You can save up to 1,000 gallons a month.
- Water plants only when necessary and try collecting rain water or even bath water for your plants.
- Fix leaky toilets and faucets. Faucet washers are inexpensive and take only a few minutes to replace. **To check your toilet for a leak, place a few drops of food coloring in the tank and wait. If it seeps into the toilet bowl without flushing, you have a leak.** Fixing it or replacing it with a new, more efficient model can save up to 1,000 gallons a month.
- Adjust sprinklers so only your lawn is watered. Apply water only as fast as the soil can absorb it and during the cooler parts of the day to reduce evaporation.
- Teach your kids about water conservation to ensure a future generation that uses water wisely. Make it a family effort to reduce next month's water bill!
- Visit www.epa.gov/watersense for more information.

Water Quality Data Table.

In order to ensure that tap water is safe to drink, EPA prescribes regulations which limit the amount of contaminants in water provided by public water systems. The following table lists all of the drinking water contaminants that we detected during the calendar year of this report. Although many more contaminants were tested, only those substances listed in the table were found in your water. All sources of drinking water contain some naturally occurring contaminants. At low levels, these substances are generally not harmful in our drinking water. Removing all contaminants would be extremely expensive, and in most cases, would not provide increased protection of public health. A few naturally occurring minerals may actually improve the taste of drinking water and have nutritional value at low levels. Unless otherwise noted, the data presented in this table is from testing done in the calendar year of the report. The EPA or the State requires us to monitor for certain contaminants less than once per year because the concentrations of these contaminants do not vary significantly from year to year, or the system is not considered vulnerable to this type of contamination. As such, some of our data, through representative, may be more than one year old. In this table you will find terms and abbreviations that might not be familiar to you. To help you better understand these terms, we have provided the definitions of the terms used in the table.

Contaminants	MCLG or MRDLG	MCL, TT, or MRDL	Detect In Your Water	Range		Sample Date	Violation	Typical Source
				Low	High			
Disinfectants & Disinfection By-Products								
(There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants)								
Chlorine (as Cl ₂) (ppm)	4	4	1.33	.33	2.02	2022	No	Water additive used to control microbes
Haloacetic Acids (HAA5) (ppb)	NA	60	45	27	68	2022	No	By-product of drinking water chlorination
TTHMs [Total Trihalomethanes] (ppb)	NA	80	62	16.5	87.1	2022	Yes	By-product of drinking water disinfection
Total Organic Carbon (% Removal)	NA	TT	1.40	NA	NA	2022	No	Naturally present in the environment
Inorganic Contaminants								
Barium (ppm)	2	2	.008	NA	.016	2021	No	Discharge of drilling wastes; Discharge from metal refineries; Erosion of natural deposits
Chromium (ppm)	100	100	.003	.003	.022	2021	No	Discharge from steel and pulp mills; erosion of natural deposits
Fluoride (ppm)	4	4	.74	.32	1.01	2022	No	Erosion of natural deposits; Water additive which promotes strong teeth; Discharge from fertilizer and aluminum factories
Nitrate [measured as Nitrogen] (ppm)	10	10	1.6	0	8.4	2022	No	Runoff from fertilizer use; Leaching from septic tanks, sewage; Erosion of natural deposits
Microbiological Contaminants								
Total Coliform (RTCR)	NA	TT	2	NA	NA	2022	No	Naturally present in the environment
Turbidity (NTU) % of Measurements less than .3	NA	.3	100%	NA	NA	2022	No	Soil runoff
Volatile Organic Contaminants								
Not Detected								
Contaminants	MCLG	AL	Your Water	Sample Date	# Samples Exceeding AL	Exceeds AL	Typical Source	
Inorganic Contaminants								
Copper - action level at consumer taps (ppm)	1.3	1.3	.11	2021	0	No	Corrosion of household plumbing systems; Erosion of natural deposits	
Inorganic Contaminants								
Lead - action level at consumer taps (ppb)	0	15	2.5	2021	1	No	Corrosion of household plumbing systems; Erosion of natural deposits	

Note-The Running Annual average for TTHM's was 81ppb for the first quarter, which is higher than the MCL of 80ppb

Descriptions	
Term	Definition
ppm	ppm: parts per million, or milligrams per liter (mg/L)
ppb	ppb: parts per billion, or micrograms per liter (µg/L)
NTU	NTU: Nephelometric Turbidity Units. Turbidity is a measure of the cloudiness of the water. We monitor it because it is a good indicator of the effectiveness of our filtration system.
positive samples/month	positive samples/month: Number of samples taken monthly that were found to be positive
NA	NA: not applicable
ND	ND: Not detected
NR	NR: Monitoring not required, but recommended.

Important Drinking Water Definitions	
Term	Definition
MCLG	MCLG: Maximum Contaminant Level Goal: The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.
MCL	MCL: Maximum Contaminant Level: The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.
TT	TT: Treatment Technique: A required process intended to reduce the level of a contaminant in Unit drinking water.
AL	AL: Action Level: The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.
Variances and Exemptions	Variances and Exemptions: State or EPA permission not to meet an MCL or a treatment technique under certain conditions.
MRDLG	MRDLG: Maximum residual disinfection level goal. The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.
MRDL	MRDL: Maximum residual disinfectant level. The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.
MNR	MNR: Monitored Not Regulated
MPL	MPL: State Assigned Maximum Permissible Level
